

ADEWUNMI ABDULHAMEED

Software Engineer

Ile-Ife, Nigeria | +234 814 350 8569 | adewunmiabdulhameed7@gmail.com | github.com/Abdulhameed-A-A | [LinkedIn](#)

SUMMARY

Computer Engineering student with hands-on software engineering experience across frontend web development and Java systems programming, combining a systems/hardware foundation with practical, shipped work. Passionate about building high-performance, robust applications and pixel-perfect user interfaces.

EDUCATION

Obafemi Awolowo University, Ile-Ife, Nigeria, B.Sc. Computer Engineering

- Expected 2028
- Relevant Coursework: Data Structures & Algorithms, Object-Oriented Programming, Database Management Systems, Software Engineering Principles, Computer Systems Architecture

EXPERIENCE

Frontend Developer, Yebaot Luxury Vehicle Marketplace | [Live Link](#) | Jan 2026 to Present

- Built a full-stack marketplace application using Next.js App Router, React, and TypeScript with responsive user interfaces.
- Engineered vehicle listing management workflows (CRUD) with dynamic client-side forms and image upload processing.
- Integrated Supabase database & REST API endpoints for seamless authentication, search filtering, and state persistence.

SELECTED PROJECTS

SwiftShare P2P File Transfer, Java, Swing, TCP Sockets, JmDNS | [GitHub](#)

- Engineered a cross-platform desktop application for zero-configuration local file sharing using Java, Swing, and FlatLaf for a modern native UI.
- Implemented peer-to-peer device discovery via mDNS/JmDNS, resolving loopback IP collisions to reliably broadcast local network addresses.
- Developed a robust multi-threaded TCP socket architecture to recursively transfer entire directory trees between Windows and Linux systems.
- Designed dynamic path normalization logic to seamlessly translate Windows backslashes and Linux forward slashes during cross-OS transfers.
- Packaged the application into standalone native installers (.exe for Windows, .deb for Linux) using the Java jpackage tool, abstracting the JRE requirement for end users.

Custom JSON Parser, Java 21, Maven, JUnit 5 | [GitHub](#)

- Developed a high-performance JSON parser from scratch in Java 21, implementing lexical analysis and an Abstract Syntax Tree (AST) architecture without relying on external libraries.
- Leveraged modern Java language features, employing sealed interfaces and records to model JSON data types immutably and enforce strict type safety across the application.
- Implemented pattern matching for switch expressions to elegantly traverse and evaluate the parsed AST, reducing boilerplate code and improving maintainability.
- Configured a continuous testing and build pipeline using Maven and JUnit 5 to ensure parser accuracy and structural integrity.

Linux System Inspector, Java, CLI, Linux Utilities | [GitHub](#)

- Developed a Java-based command-line utility to monitor and report real-time Linux system metrics, including kernel details, memory/swap usage, disk space, and network status.
- Leveraged Java ProcessBuilder to execute native Linux commands and efficiently parsed raw standard output streams into structured Java record classes.
- Implemented custom parsing logic to analyze system resources, including a disk health evaluator that categorizes partition status (Healthy, Warning, Critical) based on usage thresholds.
- Designed an interactive console menu system to allow users to generate modular system metric reports or a comprehensive system-wide summary on demand.

TECHNICAL SKILLS

- Languages: TypeScript, JavaScript, Java, SQL
- Frontend/Mobile: React.js, Next.js, Tailwind CSS
- Backend/DB: REST APIs, Supabase, Relational Databases
- Tools/Concepts: Git / GitHub, JUnit, Maven, Object-Oriented Programming, Data Structures & Algorithms

CERTIFICATIONS

- Introduction to agent skill, Anthropic (May 2026)
